

# Quiz 5 - Backtracking and Greedy Algorithms

Due Feb 8 at 11:59pm

Points 10

Questions 6

Available until Feb 9 at 11:59pm

Time Limit None

Allowed Attempts 2

## Instructions

### Instructions

This quiz will test your understanding of the material covered so far this week ([MLOs](#)).

This is an online quiz. There will be no time limit to the quiz. You can attempt the quiz twice and the best of the scores will be retained. This is open notes and open internet quiz but refrain from discussing with anybody during the exam.

Note that this test cannot be taken past the due date for any credit.

This quiz is worth 10 points.

You can view the correct answers here after the due date.

## Attempt History

	Attempt	Time	Score
KEPT	<a href="#">Attempt 2</a>	7 minutes	7 out of 10
▶ TEST	<a href="#">Attempt 2</a>	7 minutes	7 out of 10
	<a href="#">Attempt 1</a>	9 minutes	7 out of 10

Score for this attempt: 7 out of 10

Submitted Feb 5 at 6:55pm

This attempt took 7 minutes.

### Question 1

1 / 1 pts

What makes the solution for the 'Activity Selection Problem' that we implemented in the exploration, a greedy approach?

**Correct!**

☐ It is similar to Dynamic Programming algorithm

We make a best available choice in each iteration and we never look back

☐ It has optimal substructure

☐ It satisfies greedy property

**Question 2****3 / 3 pts**

Pick the statements which are True.

**Correct!**

A greedy algorithm is hard to design sometimes as it is difficult to find the best greedy approach

**Correct!**

Greedy algorithms are efficient compared to dynamic programming algorithms

**Correct!**

Dynamic programming technique would always return an optimal solution

☐ Greedy algorithms would always return an optimal solution

**Question 3****1 / 1 pts**

All possible greedy algorithms, at each step, choose what they know is going to lead to an optimal/near optimal solution.

**Correct!**☒ True☐ False**Question 4****1 / 1 pts**

Can 0/1 knapsack problem be solved using the Greedy algorithm technique to obtain an optimum solution to fill the knapsack?

0/1 knapsack problem (This is the problem that we saw in the previous modules) When have n items and their values given. We are provided with a knapsack of capacity X. We have only one copy of each item. We need to maximize the value of our knapsack with items that we pick.

☐ True☒ False**Correct!**

Greedy solution might not give us an optimal solution.

**Question 5****1 / 3 pts**

Fill in the below pseudocode for activity selection problem using the greedy approach. The function returns the count of the maximum number of activities that can be selected.

activitySelection(activities):

    sortBasedonEndTime(activities) # uses quick sort to sort the activities

    for activity in activities:

if `currentEndTime <= activity.startTime`:

`result.append(activity)`

[ Select ]

return result

Time complexity for the pseudocode will be

[ Select ]

**Answer 1:**

result = result + 1

Incorrect Answer

You Answered

result.append(activity)

**Answer 2:**

currentEndTime = activity.endTime

Correct!

**Answer 3:**

$O(n \log n)$

You Answered

$O(n^2)$

Correct Answer

Quick sort has worst case of  $O(n^2)$  time complexity

## Question 6

0 / 1 pts

The asymptotic runtime of the solution for the combination sum problem that was discussed in the exploration is \_\_\_\_\_.

Correct Answer

☐ Logarithmic☐ Exponential☐ Linear

You Answered

☒ N FactorialQuiz Score: **7** out of 10
